strand CDNA was primed with a Not I - oligo(dT)15 primer
(5 peacTAGTTCTAGATCGGGGGGGCGCCCTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to Sal I adaptors (BRL),
digested with Not I and cloned into the Not I and Sal I
sites of the pSPORTI vector (BRL). Library was constructed
by Matthew Clark (Lehrach lab; ICRF, London and Max Planck
Institut fuer Molekulare Genetik, Berlin). CDNAs for EST
analysis were selected following oligonucleotide
hybridization fingerprinting of arrayed clones from
zebzafish late somitogenesis (25 ss), adult liver or
embryonic shield stage (3.6 h) libraries. Fingerprint
data were used to computationally cluster cDNAs, and a
single CDNA from each cluster was chosen for sequencing.
In some cases multiple members of the same cluster were
sequenced to assess clustering parameters or single clones
were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

from Stratagene (La Jolla, AL, (Carally, E.S.), according to manufacturer's instructions. Briefly, 1.5 ug mRNA was reverse transcribed using a hybrid oligo(dT) linker-primer that contains an Xho I site. First strand synthesis was primed with the linker- primer and transcribed using Molloney murine leukemia virus reverse transcriptase (MMLV-RT) and 5-methyl dCTP. The second strand was synthesized with DNA polymerase and RNase H. Complementary DNA was blunt ended with Pfu DNA polymerase. Ingated with EcoR I adapters in the presence of ligase and digested with Xho I. The CDNA was sequentially size fractionated over Pharmacias ize Sep400 (Pharmacia, Uppsala, Sweden) and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA) columns to enrich for CDNA greater than 400bp and 1000 bp. respectively. The CDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with EcoR I and Xho I. The phagemid was packaged with Gigapak II Gold and, upon titration on XLI Blue MRF' cells, the yield of the phage library was estimated to be 11,100,000 recombinants. Stratagene's ExAssist Interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the rescued library, individual CDNA clones were selected and grown in 96-well, 2 ml growth plate. Plasmid DNA was purificed from the phage clusted culture with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          strength Biggs terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MJ Tetrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POP5 polymer (Applied Biosystems, Foster City, CA). The frequency distribution of the library is as follows: 72% of genes have I copy; 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function; 45% of have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTS and 20% are unidentified."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Concert96(TM) plasmid purification kit (Invitrogen, carisbad, CA) as instructed by the manufacturer. ESTs from the 5' end of the CDNA clones were generated with the universal M13 reverse primer (CAGGAAACAGCTATGACC) and 25%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

polylinker; Site_l: Not I; Site_2: Eco RI; The UI-R-Bil
library is a subtracted library derived from the following
tissues: atrium at 16.5 dpc, ventricle at 16.5 dpc, AV
canal at 16.5 dpc, atrium at 15 dpc, ventricle at 15 dpc, AV
canal at 16.5 dpc, ventricle at 13 dpc, and adult heart.
For a detailed description of the library from which this
clone was derived, please visit our web site at

The present sequence is that of DNA clone ACO1136_A. This includes an open reading frame that encodes the novel, secreted human growth/differentiation factor-6 (GDF6)-like protein, AMF10 (see AAM50216). AMF10 is expressed in astrocytoma and glioma-derived tissue. DNA encoding the AMF8 may be useful in gene therapy, and the protein may also be used as a therapeutic, especially in treatment of cancer and other cell proliferative disorders. Generally, the AMF1-10 (AMFX) nucleic acids and proteins of the invention are useful for treating or preventing AMFX-associated disorders, e.g. a disorder cell adhesion or migration pathway modulation, chemoresistance, radiotherapy resistance, survival in trophic factor limited secondary tissue site microenvironments, connective tissue disorders, tissue remodeling, oncogenesis, cancer of the breast, ovary, cervix, prostate, endometrium, stomach, colon, lung, bladder, kidney, brain, and soft-tissue, cellular transformation, developmental tissue remodeling, inflammation, blood clot formation and resorption, haematopoiesis, andiopensess, multidrug resistance related to organic anion transporters, malignant disease progression, autocrine and paracrine regulation of cell growth, and cellular responses to external stimuli, and other disease cellular responses to external stimuli, and other cellular responses.
                                                                                                                                                                                                                                     New AMF1-10 polypeptides and encoding polynucleotides, useful for treating or preventing disorders related to modulation of cell movement, cell signal processing, cell adhesion or migration pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chromosome mapping, tissue typing, diagnostics, forensics and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to new isolated NOVX polypeptides named NOVI-NOV9. The invention can be used for identifying an agent (a cellular receptor or downstream effector) that binds to the polypeptide. The molecules of the invention are useful for treating or preventing NOVX-associated disorders in humans. The antibody of the invention is useful for determining the presence or amount of NOVX in a sample, and for treating a pathological state in a mammal. The method of the invention is useful for determining the presence of an amount of NOVX in a sample which is used as a marker for cancerous cell or tissue type. The molecules of the invention are useful in the manufacture of a medicament for treating or preventing cancer, tumour, bone disorders, avascular necrosis, allergy, haematopoietic disorders, immune disorders,

The present invention relates to new extracellular messenger polypeptides and polynucleotides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, stroke, or Alzhehmer's disease), autoimmune/inflammatory disorders (e.g. rallergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), endocraine disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), and cell proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of extracellular messengers. XMES may also be used in the treatment of viral, bacterial, fungal, parasitic, protozoal and helminthic infections, trauma, disorders associated with hypoptuitarism, hypothyroidism or gonadal steroid hormones, and proper such as type I or type II diabetes mellitus. The XMES may be used for somatic or germline gene therapy. The present sequence is human XMES<sup>2</sup> CDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            67
                                             This nucleotide sequence, designated v1-1, encodes a novel bone morphogenetic protein (see AAW26591), designated BMP-13. It was isolated from a human genomic library using a probe (see AAF90398) based on a partial BMP-13 sequence. A claimed method for inducing formation of tendon and/or ligament tissues involves administration of a composition containing at least one protein selected from BMP-13, MP52 (see AAW36590) and BMP-12 (see AAW36589). The method is used for tissue (including skin) healing and repair. This is useful for treating tendonitis, carpal tunnel syndrome and other defects of traumatic or congenital origin, in cosmetic surgery and to improve fixation of tendons or ligaments to bone. The specified proteins can also be used to increase activity of other BMPs e.g.

The invention relates to a chimeric DNA comprising a DNA sequence encoding a propeptide from a member of the transforming growth factor (TGF)-berts superfamily of proteins. This DNA is linked to a DNA sequence encoding an amino acid sequence encoding a mature polypeptide consisting of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA sequences are useful for producing proteins which induce tendon/ligament like tissue formation, and for isolating and cloning further DNA sequences encoding BMP-12 related proteins with similar activity. The proteins are useful for the induction of tendon/ligament-like tissue formation, wound healing, ligament and other tissue repair, augmenting the activity of bone morphogenetic proteins, and for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects. The present sequence is human VL-1 DNA fragment also designated as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric DNAs, useful for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects, comprises DNA encoding propeptide linked to DNA encoding bone morphogenetic proteins (BMP)-12. BMP-13 or MP52 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GACAAAGAAGAGCTGGTGGGCGCGGAGCTGCGGCTCTTTCGCCAGGCGCCCTCAGCGCCC 558

EMP-12 related proteins are a subset of the BMP/TGF-beta/Vg-1 family of proteins, including BMP-12 and VL-1. VL-1 is designated bmp-13. Like BMP-12, it is expected that BMP-13, as expressed by mammalian cells such as CHO cells, exists as a hetrogeneous popn. Of active species of BMP-13 protein with varying N-termini. It is expected that all active species will contain the As sequence beginning with the 19th Cys residue of the mature protein until the stop codon after the 120th residue of the mature protein. Other active species contain additional As sequence in the N-terminal direction. AAQ96208 is a partial DNA sequence and AAR78730 is the derived AA sequence of a pottion of the 2.5 kb DNA insert of the plasmid subclone pGBMJLDC31/2.5, derived from clone lambdaJLDC31.

```
The sequence encodes cattle articular cartilage-derived morphogenetic protein-2 (CDMP-2). Primers AAT13603-06, constructed from conserved motific from bone morphogenetic protein, have been used in reverse transcription-polymerase chain reaction amplification of a cattle articular chondrocyte cDNA library, generating products of 120 and 280 bp, which are then used to screen a cattle articular cartilage CDNA library. The 5'-end with the N-terminal methionine codon and signal peptide sequence is missing. CDMP-2 is present in a purified cartilage extract (claimed) which stimulates local cartilage formation and repair when combined with a matrix and implanted in a mammal. The protein may be used in therapy of e.g. chondromalacia or osteoarthritis, to heal joint surfaces, or to repair cartilage after
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GCAGGGGTCCGCGCGTGGTGCCCCACGAGTACATGCTGTCAATCTACAGGACTTACTCCA 349

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This DNA sequence, designated mV2, encodes a portion (see AAW26595) of a murine homologue of human bone morphogenetic protein (BMP) 13 (see also AAW26591). It was isolated from murine genomic DNA using primers (see AAT90393-94) based on the human BMP-12 gene (see AAT90385). Human BMP-12 (see AAW26590) polypeptides are used in a claimed method for inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119 CAGCTGTGCGTGCAGTTGCGGGCAGCCTGGGGTGAGCTGGACCCCGGGGATACGGGGGCG

```
The invention relates to a chimeric DNA comprising a DNA sequence encoding a propetide from a member of the transforming growth factor (TGF)-beta superfamily of proteins. This DNA is linked to a DNA sequence encoding an amino acid sequence encoding a mature polypeptide consisting of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA sequences are useful for producing proteins which induce tendon/ligament like tissue formation, and for isolating and cloning further DNA sequences encoding BMP-12 related proteins with similar activity. The proteins are useful for the induction of tendon/ligament-like tissue formation, wound healing, ligament and other tissue repair, augmenting the activity of bone morphogenetic proteins, and for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects. The present sequence is murine partial mV2 DNA which is homologous to human BMP-12 or VL-1 sequences of the invention.
                                                                                                                          new cnimeric DNAs, useful for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects, comprises DNA encoding propeptide linked to DNA encoding bone morphogenetic proteins (BMP)-12, BMP-13 or MP52 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1131
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1071

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligos #6 and #7 (AAQ96218 & AAQ96219) are used as primers for the amplification of a 275 bp DNA probe, the internal 269 bp of which corresp. to nts #607 to #865 of AAQ96207, from the BMP-12 encoding plasmid subclone PCR1-1#2. This probe was radioactively labelled and used to screen a murine genomic library. DNA sequence analysis of one of positively hybridising recombinants named MVR32 indicates that it encodes a portion of the mouse gene corresp. to the PCR Product mV2 (murine homolog of the human VL-1 sequence AAQ96213. The partial DNA sequence of this subclone and corresp. AA translation are given in AAQ96224 & AAR78739.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         - used in

This invention relates to an antibody that specifically binds to a growth differentiation factor-6 (GDF-6) polypeptide. GDF-6 is a member of the transforming growth factor-beta (TGF-beta) family of proteins, and is expressed in placental tissue. The antibody of the invention can be used to identify tissue samples of placental origin. It may also be used to treat choriocarcinomas, or detect primary and metastatic neoplasms of placental origin. The antibodies may also be used to treat call proliferative diseases, and GDD-6 may be used as an indicator of developmental anomalies in prenatal screening procedures. The present sequence represents DNA encoding the murine GDF-6 protein.

DNA sequence (AAQ96212) was radioactively labelled and used to
 Gaps
 screen a human genomic library. A positive clone was designated lambda-HuG-48. This bacteriophage was deposited under ATCC 75625 on Dec. 1993. The oligo hybridising region of this phage is localised to a 3.2 kb BamH1 fragment which was subcloned to PCR1-1#2 and deposited under ATCC 69517 on 7 Dec. 1993. The partial DNA sequence and derived As sequence of the 3.2 kb DNA insert of the plasmid subclone PCR1-1#2, derived from clone lamba-HuG-48 are shown in AAQ96207 and AAR78729 respectively. Additional DNA sequence of the 3.2 kb BamH1 insert of the plasmid PCR1-1#2 is given in AAQ96207 is contained in AAQ96215. As AAQ96215 is deerived fra a genomic clone it is difficult to determine the boundary between the 5' extent of coding sequence and the 3' limit of intervening

 1348
 This nucleotide sequence, designated v1-1, encodes a novel bone morphogenetic protein (see AAW25689), designated BMP-12. It was isolated from a human genomic library using a probe (see AAY90389) based on a partial BMP-12 sequence that had itself been identified using probes (see AAY90387-89) based on conserved regions in BMPs and TGF-beta proteins. A claimed method for inducing formation of tendon and/or ligament tissues involves the administration of a composition containing at least one protein selected from BMP-12, MP52 (see AAW26590) and BMP-13 (see AAW26591). The method is used for tissue (including skin) healing and repair. This is useful for
 MP-52

 encoding a propertide from a member of the transforming growth factor (TGP) beta superfamily of proteins. This DNA is linked to a DNA sequence encoding an mature polypeptide consisting of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA sequences are useful for producing proteins which induce tendon/ligament like tissue formation, and for isolating and cloning further DNA sequences encoding BMP-12 related proteins with similar activity. The proteins are useful for the induction of tendon/ligament-like tissue
 formation, wound healing, ligament and other tissue repair, augmenting the activity of bone morphogenetic proteins, and for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects. The present sequence is a DNA encoding human BMP-12 protein.
 New chimeric DNAs, useful for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects, comprises DNA encoding propeptide linked to DNA encoding bone morphogenetic proteins (BMP)-12 BMP-13 or MP52 -

•• Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
